

The logo

The logo is the wordmark "ucm." in lowercase, closed by the accent dot. It is a delivered asset: the files are the logo, and nothing else is.

The wordmark rule

- The logo is always **ucm.** in lowercase, closed by the accent dot in #FF9932. Never "UCM", never "Ucm", never without the dot.
- The wordmark is set in Nunito Extra-Bold 800. Nunito is used for nothing else, anywhere.
- Never retype or rebuild the logo. The face and tracking are documented, but the wordmark is an asset, not a text style; use the delivered files.
- The lowercase form belongs to the logo alone. In running text the name is written UCM. Domain-style names such as ucm.jobs and ucm.agency stay lowercase, because they are domains, not the wordmark.

The accent dot

The dot is #FF9932, the value the specs list as the logo accent dot. It is not the triad yellow #FCC224. The dot color belongs to the wordmark and nothing else: it never colors buttons, icons, text, or any other UI element.

The files

Only use the files from the official branding elements folder on Google Drive (UCM account required):

drive.google.com/drive/folders/1I6p89HNb2kteBE6LIKWr4fAlxixvjdFb

No logo files live in the repo yet, by decision of 2026-07-06: they enter the repo only when the brand owner gives an explicit go. Until then the Drive folder is the single source.

Which logo goes where

Surface	Logo form
Interface chrome: the ucm.jobs header and footer, the docs site header	The wordmark as type: "ucm." in Nunito Extra-Bold 800, letters in ink #001E2B, the dot in #FF9932. The spec type style is 22px with tracking -0.04em.
Browser favicon, light scheme	The dark wordmark icon, 32 and 48px
Browser favicon, dark scheme	The light wordmark icon, 32px
Touch and app icons	The dark wordmark icon at 180, 192, and 512px

Decks, documents, social media,
print, partner and press use

Delivered files from the branding elements folder, never typed

Interface chrome is the one place the wordmark may be typed instead of placed, because that code is under design-system control and uses the documented face and tokens. Every other surface uses the delivered files.

The set, one by one

The images below are production records: the assets the live www.ucm.jobs site serves today. They show the current state including its known divergences (next section); the official kit files stay on Drive until the brand owner's go.

Live header pill, www.ucm.jobs, 2026-07-07

The typed wordmark, interface chrome only

- Use for: the site header and footer and the docs header, as code.
- Letters in ink #001E2B, the dot in #FF9932, on a white pill; white here is an action-surface use, matching the button exception.
- Never use the typed form in a document, deck, image, or any surface outside the design-system-controlled chrome. There it is always a placed file.

ucm-logo_pine.png, production, 512px

The dark wordmark icon

- Use for: the light-scheme browser favicon (32 and 48px) and the touch and app icons (180, 192, 512px).
- The icon sits on light or system-provided surfaces; never place it on the dark hero, that is what the light icon is for.
- Production state shown: dotless and in the retired Pine color. The rule says closed by the dot and ink #001E2B; see the divergences below.

ucm-logo_white.png on a hero-dark
#0A0F14 swatch

The light wordmark icon

- Use for: the dark-scheme browser favicon (32px) and dark surfaces where the dark icon would vanish.
- The source file is white on transparent; it is shown here on a hero-dark #0A0F14 swatch so it is visible. Content text on dark surfaces stays ink-on-dark #F0F0EB; the pure white in this icon is a logo-only exception, pending the owner's ruling.
- Production state shown: dotless, same divergence as the dark icon.

The delivered kit files

No images yet: the kit lives in the branding elements folder on Drive and its files enter the repo only on the brand owner's go. Use the kit for everything that is not interface chrome or a favicon: decks, documents, social media, print, partner and press use. When the kit's file list is known, each variant gets its own entry here.

Known divergences, logged in the tracker

The live ucm.jobs site diverges from the rules above in ways only the brand owner can resolve (update production, or amend the rule):

- The live dot renders in the triad yellow #FCC224, not #FF9932, and the live header type is 18px with letter-spacing 0, not the spec style.
- The production favicon and app icons draw the wordmark without the closing dot, and in the retired Pine color rather than ink #001E2B.

Until those decisions land, this page states the rules and the tracker holds the audit.

Motion

Logo motion follows the global motion rules: transform, opacity, and clip-path only, ease-out, off under reduced motion. The logo reveal and letter animations use the standard ease cubic-bezier(0.16, 1, 0.3, 1). Marquee logo parades (client and partner logos) are a brand-mode pattern and never appear in product mode.

Not yet migrated from the old Brand Guide

Clear space, minimum size, and placement contrast rules live in the old Brand Guide and have not been migrated into this book yet. Until they are, follow the Brand Guide and the proportions of the delivered files. The same applies to variants (dark surface, single color): whatever the branding

elements folder delivers is sanctioned; nothing else is. Both gaps are logged as open questions in the tracker.
